TRANSPORTATION DIVISION

Donald E. Church, Chief

ACKNOWLEDGMENTS—The 1967 Census of Transportation was conducted under the general direction of **Donald E. Church**, Chief, and **Walter F. Buhl**, Assistant Chief of the Transportation Division. Within this Division, responsibility was shared by the following individuals who contributed significantly to the entire program: **Jerome Litzky**, Chief, Survey Programs Branch; **Kathryn C. Farmer**, Chief, Operations Management Branch; **Max E. Van Horn**, coordinator of data processing; **Kathleen E. Sier**, analyst; **Donald Wright**, sampling and statistical specialist; and **Evelyn S. Davis**, publication program specialist.

Advice on sampling and other technical statistical aspects was provided in the Statistical Research Division by **Max Bershad**, Assistant Chief.

Planning, procedures, programing, and control operations were performed in the Systems Division under the direction of **Sol Dolleck**, Chief, and **Betty S. Mitchell**, Assistant Division Chief; **Don L. Coffey**, Chief, Methods, Procedures, and Quality Control Branch; **Maxwell Jeane**, quality control; **Odessa M. Shannon**, **Richard Russell**, and **Lloyd H. Fredericks**, processing procedures; **Evelyn G. Jett** and **Mary E. Brady**, EAM procedures; **Desmond J. Carron**, Chief, Programing Branch; **Edna J. Foust**, planning and programing; **James R. Pepal**, Chief, Processing Coordination Branch; **Percy R. Moore**, processing coordinator.

Mailing and data correction operations were performed in Processing Division under the direction of **M. Douglas Fahey**, Chief.

Clerical check-in and data punching, data transmission, and control operations were performed in Jeffersonville Census Operations Division under the direction of **Joseph F. Arbena**, Chief, with clerical supervision by **Virginia Powell**.

In the Administrative and Publications Services Division, editorial supervision and report planning was provided by **Geraldine Censky**.

Preface

The census of transportation, together with the censuses of business, manufactures, and mineral industries, comprise the economic census program of the Bureau of the Census. This program is required by law under Title 13 of the United States Code, sections 131 and 224. The present economic census collects statistics for the year 1967. Future censuses are scheduled by law for 5-year intervals.

A large segment of transportation data is available from regulatory and other government agencies, and private organizations. For that reason, the statutory provisions concerning the census of transportation directed the Bureau to collect the kinds of data that were not publicly available from other sources. The objective was to avoid duplication and fill important gaps in transportation information.

The census of transportation was undertaken for the first time on a National basis in 1963. The 1967 census was taken under three separate surveys—National Travel, Truck Inventory and Use, and Commodity Transportation, each on a sample basis. The surveys are independent of each other and the results are published in three distinct series of reports.

1967 Census of Transportation Publication Program

The 1967 Census of Transportation is comprised of three major surveys. Each survey, described below, was conducted separately and independently.

National Travel Survey

The National Travel Survey is concerned with the volume and characteristics of travel by residents of the United States during the year 1967. The survey consists of a nationwide probability sample of about 18,000 households who reported quarterly by mail. The data show the estimated number of households in which some one took one or more trips, persons who took at least one trip, person-trips, person-nights, and person-miles. Data are shown by such travel characteristics as means of transport, purpose of trip, duration of trip, distance, size of party, type of lodging, origin and destination regions, and by such household characteristics as family income level, occupation and education of household head, and age of traveler.

Final data are included in volume I of the 1967 Census of Transportation.

Truck Inventory and Use Survey

This survey presents data on the Nation's truck resources, other than vehicles owned by Federal, State, and local government agencies. The survey consists of a probability sample of motor truck licenses in each of the 50 States and the District of Columbia. The data show the number of trucks and tractor-trailer combinations, truck-miles, and average miles per truck, by such characteristics as major use, body type, body size, vehicle-size class, year

model, type of fuel, range of operation, vehicle type and axle arrangement, products carried, and maintenance.

Final data for each of the 50 States, the District of Columbia, the nine geographic divisions, and the United States as a whole, are contained in volume II of the 1967 Census of Transportation.

Commodity Transportation Survey

This survey presents data on the transportation and geographic distribution of commodities shipped intercity by the industrial sector of the United States. A probability sample of about 1.4 million bills of lading or other shipping documents was selected from the files of approximately 13,000 manufacturers throughout the country representing the universe of about 100,000 plants with total employment of 20 or more employees. The data are classified by (1) shipper groups and shipper classes, (2) geographic areas, such as production areas, geographic divisions, and selected States, and (3) commodity groups. Data are shown for tons and ton-miles by means of transport, length of haul, commodity, weight, origin and destination areas, size of plant based on total employment, and availability of transport facilities. Percentage distributions of shipments by means of transport, distance shipped, and availability of transportation facilities are also presented for smaller manufacturing establishments.

Final data are presented in volume III of the 1967 Census of Transportation which consists of three separate books: Part 1, Shipper Groups; Part 2, Production Areas and Selected States; and Part 3, Commodity Groups.

Introduction

1967 Census of Transportation Federalism Program

The 1967 Census of Transportation is the first of a series of censuses that will provide information on the transportation system and its impact on the economy and environment.

Introduction

GENERAL

This survey presents statistics on the volume and characteristics of intercity commodity shipments originated by manufacturers in the United States during 1967. Its main purpose is to provide essential statistics on selected aspects of intercity transportation that are not available from other sources. Another primary objective is to provide a "new" dimension to production data; that is, to provide the geographic link between major supply areas and their markets or redistribution areas.

The tabulations were based on detailed information obtained from a sample of about 1.4 million shipping records drawn from the files of about 13,000 manufacturing establishments that represented essentially the Nation's industrial universe.¹

The complete series of data for the Commodity Transportation Survey is published as Volume III of the 1967 Census of Transportation and consists of three books: Part 1 provides data on the transportation and distribution of products by shipper groups and shipper classes; Part 2 is concerned primarily with the geographic distribution of products, showing traffic flows from each of the 25 production areas and 20 leading States, and also between those origin areas to major destination areas; Part 3 provides maximum commodity detail, largely at the National level.

SCOPE OF SURVEY

The survey includes the entire industrial universe of manufacturing establishments with 20 or more employees located in the 48 conterminous States and the District of Columbia except for the following industries, as described in the Standard Industrial Classification (SIC) Manual:²

- SIC 19, Ordnance and accessories
- SIC 2026, Fluid milk
- SIC 205, Bakery products
- SIC 2097, Manufactured ice
- SIC 241, Primary forest products
- SIC 27, Printing, publishing and allied industries

Ordnance and accessories presented security problems, and plants in other industries primarily serve local

¹As described in more detail elsewhere, a few classes of industries and all small plants (i.e., plants with less than 20 employees) were not included in this sample. However, less detailed "traffic profile" information was obtained for the printing, publishing, and allied industry group, and for plants having 10 to 19 employees in all other "shipper groups". This information was originally issued in special reports and is included in the appendix to Volume III, Part 3.

²See Standard Industrial Classification Manual, 1967, Executive Office of the President, Bureau of the Budget.

markets. The industrial "universe" is identical to the one used for the 1963 Commodity Transportation Survey, except for the exclusion of plants with less than 20 employees. Establishments located in Alaska and Hawaii were not within the scope of the survey.

SAMPLE DESIGN

A two-stage probability sample design was used. The first stage involved the drawing of a probability sample of about 13,000 plants from the universe. The second involved the selection of a probability sample of about 100 to 200 bills of lading or other shipping documents on file at each of the sampled plants. The national sample consisted of slightly more than 1.4 million shipping records. These records cover all types of commodities shipped intercity by manufacturers, and all modes of transportation except pipeline. Specific facts, such as origin, destination, commodity, weight, and means of transport were recorded from each of the sampled documents.

The term "probability sample" as used here means that the chance for selecting each document from the millions of such documents in the universe is known and is not equal to zero. The information from a probability sample can be expanded to approximate the total that would have been obtained by a complete count, and the sampling variability can be estimated from the sample itself.

The sample design is rather complex.³ In general, the first stage involved the classification of manufacturing plants into 86 shipper classes. These classes were then regrouped into six "tonnage divisions," based on the total tons shipped by the shipper class in the 1963 survey. Each manufacturing plant also was identified by its location and classified into two geographic strata: (1) Located in a production area or (2) located outside of any production area.

Within each of those six tonnage divisions and two geographic areas, the probability of selecting any given plant in the universe was proportionate to the "intercity tonnage rating" of the plant. The rating for each plant was based on the intercity tons shipped by the average plant of the same shipper class and employee size group in the 1963 survey.

With respect to the allocation of plants within the sample, it was decided that the relative degree of precision and detail should be somewhat greater for the shipper classes in the large tonnage divisions than for those in the small tonnage divisions. An average of about 195 plants per shipper class was set as the target in each of the four largest tonnage divisions, and half that number per shipper class in the two smallest tonnage divisions. It also was decided that greater precision was needed for data on traffic flows from production areas than from the balance of the country. The probability of selecting a specific plant located in a production area was set at twice the probability of selecting an otherwise comparable plant outside of a production area.

³A detailed technical description may be obtained from the Transportation Division, Bureau of the Census, Washington, D.C. 20233.

After selecting the plants, the next stage involved the selection of a probability sample of bills of lading or other shipping papers at the company headquarters or individual plants. Several alternative standard plans were used, depending largely on the filing system used by the company. For example, in files organized by serial number, the procedure involved drawing every "nth" record, after taking a random number start. In large chronological files, a two-stage design was used--a sample of dates and a sample of shipping papers within those dates. Special designs were made for recordkeeping situations that could not be sampled readily by one of the standard plans.

1967 DATA COMPARED WITH 1963

The 1967 survey is comparable with 1963 in most respects, except for a difference in scope. The 1967 survey represents intercity shipments (i.e., beyond the local area) of manufacturing plants with 20 or more employees. The 1963 survey represented all establishments, irrespective of size. Plants with less than 20 employees in 1963 originated about 4 percent of the total intercity shipments by manufacturers.

Comparisons between 1967 and 1963 *adjusted* for the difference in scope (that is, plants with less than 20 employees) are shown only for total tons shipped by each shipper group and shipper class (see Part 1 of this volume). All other comparisons in Part 1 as well as Part 2 (area data) are unadjusted. No comparisons are made in this 1967 commodity segment, but similar (but unadjusted) commodity data for 1963 were shown in Volume III, Parts 1 and 2, of the 1963 Census of Transportation.

In general, small plants tend to serve geographically smaller market areas and to use highway transport more extensively than larger plants. The exclusion of small plants in 1967 should tend to reduce somewhat the relative share shown for motor carriers and private trucks, shorten somewhat the length of haul, and reduce tons and ton-miles. However, the differences generally should be small.

With respect to interpretation of increases and decreases of the estimated number of tons shipped, those changes do not necessarily reflect corresponding changes in production or consumption of the products of these industrial classes. For example, a trend toward increasing production in plants located in consuming centers would tend to decrease the total tons shipped as measured in this survey, because local shipments are not reported. A proportionately greater decrease might occur in ton-miles because of shorter hauls for the balance of shipments that moved beyond the local area. Furthermore, each of these estimates is subject to sampling variability as discussed in a subsequent section.

RELATIONSHIP TO CENSUS OF MANUFACTURES DATA

GENERAL--The Commodity Transportation Survey supplies an added spatial dimension to the Census of Manufactures with respect to commodity flows from sources of supply to redistribution or market areas, by providing data on the geographic distribution of

intercity shipments originated by industrial plants during 1967.

Detailed data concerning the industrial universe can be obtained from the Census of Manufactures reports. Among the leading facts of interest for transportation analysis from that source is the geographic location of production as measured by the number of establishments, number of employees, value of production or shipments, and cost of materials which may be used as a rough indicator of the inbound shipment volume.

Each manufacturing establishment in the Commodity Transportation Survey was requested to report, among other things, the commodity, weight, means of transport, and destination for each of its sampled shipments. About 97.5 percent of the total tons shipped were to domestic destinations. However, a small percentage of the documents showed foreign destinations. For those export shipments, the shipper was asked to report the "port of exit" as the destination of the domestic segment, and to list the foreign country of destination. The objective was to measure specifically the domestic segment and to explore the feasibility and usefulness of obtaining supplementary information on foreign destinations.

An analysis and summary of data on interior origins and domestic means of transport of export shipments as reported by manufacturers in the 1967 Commodity Transportation Survey has been released by the Bureau of the Census as a special report, and is included in the appendix to Volume III, Part 3.

DEFINITION OF SHIPMENTS--Since the definition of shipments is broader in the Census of Manufactures than in the Commodity Transportation Survey, data on shipments in the two reports are not fully comparable. In this report, tons and ton-miles of shipments relate to production that actually moves by some means of transportation (other than pipeline, or under own power, or towed away) beyond the local area of the plant. These are usually called "intercity" shipments, even though neither the origin or destination necessarily is in a city.

In the Census of Manufactures, the term "shipment" includes not only the products made in the establishment, but also those made elsewhere under contract from materials owned by the establishment, receipts for contract work performed for others, and miscellaneous activities.

Aside from the differences in units of measure (tons and value), the primary difference is the volume of commodities that do not move beyond the local area. For example, the entire output of one plant (such as a metal-can manufacturing establishment) may be delivered to a physically adjacent plant (such as a fruit canning establishment) by conveyor belt. In that instance, the output of metal cans would be included in the value of shipments in the Census of Manufactures, but the establishment and its output would be "out of scope" (that is, not counted) in the Commodity Transportation Survey. The reason for being out of scope is that its shipments were local. However, if at least 10 percent of the production of that metal-can manufacturing plant were shipped beyond the local area, the plant would be "in scope," but only the intercity (nonlocal) shipments would be included in the commodity shipment data.

Comparisons between the volume of shipments as measured in tons by the Commodity Transportation Survey and in value by the Census of Manufactures for any given shipper class should be interpreted with caution. The ratio of tons to value is not only affected by differences in the relative volume of "local shipments" among plants, even within the same industry, but also differences in the relative value per ton of commodities in the total product mix for a shipper class or shipper group. The classification of shippers (that is, industrial establishments) into shipper groups and shipper classes is based on the Standard Industrial Classification used to classify establishments in the Census of Manufactures. In that respect, the two surveys are comparable. However, with respect to commodities, the product codes used in the Census of Manufactures differ from the commodity codes used for transportation.

METHOD FOR ESTIMATING TONS, TON-MILES, DISTANCE, AND SIZE OF SHIPMENT

The basic source document for weight, distance, and size of shipment is the individual shipping paper--the bill of lading, sales invoice, summary record, etc.

Estimates of total tons are shown in the first column of tables involving tons shipped. These figures represent the approximate total that probably would have been obtained by a complete enumeration of all shipments. These estimates are subject to sampling variability and response errors.

The estimates of tons were made by multiplying the actual weight shown on the record for each shipment by the reciprocal of the sampling fraction for that shipment, and aggregating the expanded value. For example, if a manufacturing establishment was selected at the rate of 1 in 5 and shipments within that plant were drawn at the rate of 1 in 20, the weight of that shipment would be multiplied by 100 (that is, 5 times 20) for purposes of estimating total tons shipped.

Estimates of total ton-miles are shown in the first column of tables involving ton-miles. These figures are the product of weight times distance. For example, a 10-ton shipment that moved between places that were 1,000 miles apart is equivalent to a 50-ton shipment that moved 200 miles. Both represent 10,000 ton-miles, although they differ in terms of both weight and distance.

The distance component is calculated by a computer program known as PICADAD.⁴ Distance is the straight-line miles between the origin and destination shown on the shipping paper, without allowance for circuitry in actual route used by the carrier. On the average, railroad "short-line" and highway "direct-route" distances exceed the calculated straight-line miles by about 24 percent and 21 percent, respectively. The actual route-mile distance is somewhat longer.

Tabulations showing the distribution of shipments by weight class were estimated from shipment data that were based on bills of lading and sales invoices.

⁴ A program developed by the Bureau of the Census specifically for processing transportation data.

Observations based on summary reports and other types of records generally show weights that are aggregates of several shipments. While both classes of records were used for estimating total tons, the latter was excluded from the analyses by size of shipment. The "size of shipment" in this report is the weight shown on the bill of lading or sales invoice, and is not necessarily the weight actually shipped in one freight car, truck, or other vehicle. Doubtless many of the smaller shipments shown in this survey were consolidated by the shipper into carload or truck lots, while some large shipments were moved in more than one freight car or truck.

SAMPLING VARIABILITY

The statistics presented in this book are estimates from a sample. The particular sample that was selected is one of the large number of all possible samples of the same size that could have been selected using the same sample design. Estimates derived from the different samples would differ from each other, and from the results of a complete census using the same procedures. This variation among the possible estimates is called sampling variability.

For example, as shown in the table on page 201, shipments of TCC 201 (Meat, poultry and small game; fresh, chilled or frozen) were estimated to have been 26,799,000 tons during 1967 and the "sampling variability" was estimated to be about 10.6 percent. In that instance, the sampling variability was expressed in relative terms which is technically called the relative variance or the relative standard error. Variance may also be expressed in absolute terms (such as tons), which in this illustration was 2,840,694 tons or the equivalent of 10.6 percent of 26,799,000 ton.⁵ When expressed in absolute (rather than percentage) terms, the variability is known technically as one standard error.

GENERAL GUIDE TO INTERPRETATION OF SAMPLING VARIABILITY—Had all elements of the universe been canvassed, the value for a given item would be included in the range—

1. From 1.0 standard error below to 1.0 standard error above the estimate obtained, for about two-thirds of all possible samples.
2. From 1.6 standard errors below to 1.6 standard errors above the estimate obtained, for about 90 percent of all possible samples.
3. From 2.0 standard errors below to 2.0 standard errors above the estimate obtained, for about 95 percent of all possible samples.
4. From 3.0 standard errors below to 3.0 standard errors above the estimate obtained, almost always.

These values may be interpreted, therefore, as defining approximate probabilities that the estimate shown would not differ by more than 1.0, 1.6, 2.0, or 3.0 of its standard errors, respectively, from the result for a complete census.

⁵ In fact, from a computational standpoint, the absolute variance is estimated from the observed values, and the relative variance is the absolute variance divided by the estimated total to which it applies.

The general level of sampling variability for each commodity shown in the United States Summary is indicated by a range of values as follows:

Sampling variability code	Range of relative sampling variability
a	0-9 percent
b	10-19 percent
c	20-29 percent
d	30-50 percent

For computational estimates the midpoint of the appropriate range may be used (for example, 1.0 standard error of code "a" may be considered to be 5 percent).

ILLUSTRATIONS OF THE INTERPRETATION OF VARIANCES—The interpretation of the general level of variances indicated by codes and ranges for the United States Summary is similar to the interpretation of the more precise numerical values shown for the selected commodities. However, the illustrations are drawn from the commodity class section to simplify the presentation.

Absolutes

For example, total shipments of TCC 201 (as noted above) were estimated to have been 26.79 million tons, plus or minus 2.84 million tons. Using the probability guide above, those figures may be interpreted as follows:

1. The chances are about 2 out of 3 a complete enumeration would have shown between 23.95 and 29.63 million tons (that is, ± 1.0 standard error).
2. The chances are about 9 out of 10 that a complete enumeration would have shown between 22.25 and 31.33 tons (that is, ± 1.6 times the standard error).
3. There is almost no chance that a complete enumeration would have shown less than 18.27 or 35.31 tons (that is, 3 times the standard error).

Relatives

The interpretation of relative variances corresponds to the interpretation for absolutes. Again taking TCC 201 as an illustration, the relative variance was estimated to be ± 10.6 percent. The chances are about 2 out of 3 that the estimate is not more than 10.6 percent above or below the figure that would have been obtained by a complete enumeration. The chances are about 9 out of 10 that the estimate is within 17 percent of the actual (that is, ± 1.6 times the relative standard error) and almost no chance that the estimate is more than 31.8 percent above or below the total that would have been obtained from a complete enumeration.

Differences Between Two Estimates

Sometimes the question arises as to what is the sampling variability of the difference between two items. For example, the total tonnage of TCC 263 (Paperboard, fiberboard and pulpboard, except insulating board) is shown as 20.6 million tons as compared with 14.4 million tons of TCC 265 (Containers, boxes and related products). The estimates indicate that TCC 263 tonnage is approximately 6.2 million tons greater than the volume of TCC 265.

Was the tonnage of TCC 263 actually larger than TCC 265? What is the variability of that 6.2 million ton difference? A rough, conservative estimate can be made readily on the basis of the standard errors shown for the two items. The relative errors shown on page 201 are 11.4 percent for TCC 263 and 9.8 percent for TCC 265. Translating those into absolutes,⁶ the standard errors are 2.3 million and 1.4 million tons for TCC 263 and TCC 265, respectively. To obtain a rough estimate of the standard error of the difference, multiply the larger of the two standard errors by a factor of 1.4, which in this instance is 1.4 times 2.3 million tons or about 3.2 million tons. The chances are about 2 out of 3 that the difference attributable to sampling would not be more than 3.2 million tons and about 9 out of 10 that it would not be greater than 5.1 million tons (that is, 1.6 times 3.2 million tons).

However, at the highest level of confidence (3 standard errors or near certainty) the difference attributable to sampling may be as high as 9.2 million tons (3×3.2 million tons) and since the difference between statistics was 6.2 million tons, we cannot say that a difference exists.

As mentioned above, this is a rough but conservative estimate of variability of the difference between two items.

Ton-Miles

All of the variances shown in this report relate to estimates of tons shipped. No variances were estimated for ton-miles. The variances for ton-miles for any given item probably are similar to, but somewhat higher than the variance shown for tons.

In addition to sampling variability, the data are subject to "response errors" that may have arisen from misinterpretation of questions, failure to find and sample some files, or other similar sources of error. However, this type of error probably is relatively minor in this survey. The sampling procedures at each plant were relatively clear and simple, and the precise facts were transcribed directly from individual shipping documents by company personnel in most instances. A high degree of quality control was exercised by the Bureau of the Census in the processing and tabulation stages.

⁶11.4 percent of 20,597 and 9.8 percent of 14,410.

382 Measuring, Controlling, and Indicating Instruments	558
386 Photographic Equipment and Supplies	562

Table A. Estimates of Sampling Variability for the 80 Selected 3-Digit Groups Presented in This Report

Interpretation of table: Column 1, "Total tons," shows that there were an estimated 26,799,000 tons of "TCC 201—Meat, poultry, and small game; fresh, chilled or frozen" shipped outside of the local area during 1967. Column 2, "Sampling variability," shows that the sampling variability for that estimate is ± 10.6 percent. Therefore, if a complete count had been made, the chances are about 2 out of 3 that the total shipments would be within ± 10.6 percent of the estimated total, or between 23,958,000 and 29,640,000 tons.

TCC group	Commodity description	Total tons (thousands)	Sampling variability (percent + or -)
201	Meat, poultry, and small game; fresh, chilled or frozen	26,799	10.6
202	Dairy products	10,049	18.6
203	Canned and preserved fruits, vegetables, and seafoods	32,475	8.8
204	Grain mill products	72,012	12.6
206	Sugar, beet and cane	12,168	20.6
207	Confectionery and related products	4,292	10.2
208	Beverages and flavoring extracts	33,118	6.2
209	Miscellaneous food preparations and kindred products	39,714	28.2
221	Cotton broadwoven fabrics	3,579	15.6
222	Man-made fiber and silk broadwoven fabrics	1,025	20.6
227	Carpets, rugs, and mats, textile	1,426	20.4
228	Yarn and thread (cotton, wool, silk, and man-made fiber)	3,849	34.2
229	Miscellaneous basic textiles	2,355	14.6
231	Men's, youths', and boys' clothing	965	13.2
233	Women's, misses', girls', and infants' clothing	993	15.0
239	Miscellaneous fabricated textile products	1,862	19.6
242	Lumber and dimension stock and miscellaneous sawmill and planing mill products	35,118	14.2
243	Millwork and prefabricated wood products, including plywood and veneer	11,768	11.6
249	Miscellaneous wood products	9,720	20.2
251	Household and office furniture	4,604	11.2
262	Paper (except building paper)	18,969	4.8
263	Paperboard, fiberboard, and pulpboard (except insulating board)	20,597	11.4
264	Converted paper and paperboard products (except containers and boxes)	9,055	9.0
265	Containers, boxes and related products, paperboard, fiberboard, and pulpboard	14,410	9.8
281	Industrial chemicals	81,026	8.2
282	Plastic materials and plasticizers, synthetic resins, rubbers, and fibers	12,442	8.0
283	Drugs (biological products, medicinal chemicals, botanical products, and pharmaceutical preparations)	1,664	14.6
284	Soap and detergents, cleaning preparations, perfumes, cosmetics, and other toilet preparations	9,526	5.6
285	Paints, varnishes, lacquers, enamels, and allied products	5,474	10.4
287	Agricultural chemicals	37,010	13.6
289	Miscellaneous chemical products	11,073	14.0
291	Products of petroleum refining	393,573	7.4
295	Paving and roofing materials	11,116	7.2
301	Tires and inner tubes	3,889	10.6
306	Miscellaneous fabricated rubber products	2,207	11.8
307	Miscellaneous plastic products	4,297	8.8
314	Footwear (except rubber)	404	16.0
316	Luggage and handbags (all materials), and other personal leather goods	205	22.4
322	Glass and glassware, pressed and blown	12,220	11.0
324	Hydraulic cement	48,051	16.2
325	Structural clay products	23,734	12.0
326	Pottery and related products	1,195	24.4
327	Concrete, gypsum, plaster, and plaster products	27,243	11.2
329	Abrasives, asbestos, and miscellaneous nonmetallic mineral products	13,578	23.6
331	Steel works and rolling mill products	112,167	4.0
332	Iron and steel castings	12,657	5.6
333	Nonferrous metals primary smelter products (slab, ingot, pig, etc., and residues)	8,440	7.2
335	Nonferrous metal basic shapes	10,417	8.4
336	Nonferrous and nonferrous base alloy castings	1,205	26.2
339	Miscellaneous primary metal products	3,491	10.2

**Table A. Estimates of Sampling Variability for the 80 Selected 3-Digit Groups
Presented in This Report—Continued**

TCC group	Commodity description	Total tons (thousands)	Sampling variability (percent + or -)
341	Metal cans	3,845	8.4
342	Cutlery, hand tools, and general hardware	1,616	14.2
343	Plumbing fixtures and heating apparatus (except electric)	1,681	12.0
344	Structural and miscellaneous metal products	14,991	11.8
345	Bolts, nuts, screws, rivets, washers, and other industrial fasteners	2,174	14.0
346	Metal stampings	5,750	15.8
348	Miscellaneous fabricated wire products	2,808	19.4
349	Miscellaneous fabricated metal products	5,495	9.6
351	Engines and turbines	1,107	6.2
352	Farm machinery and equipment	3,958	9.0
353	Construction, mining, and materials handling machinery and equipment	5,549	6.0
354	Metalworking machinery and equipment	2,135	22.2
355	Special industry machinery (except metalworking machinery)	1,479	16.2
356	General industrial machinery and equipment	2,932	17.8
357	Office, computing, and accounting machines	463	11.0
358	Service industry machines	2,596	16.2
359	Miscellaneous machinery and parts (except electrical).	693	26.2
361	Electrical transmission and distribution equipment	1,601	12.6
362	Electrical industrial apparatus	2,100	13.6
363	Household appliances	4,311	23.0
364	Electric lighting and wiring equipment	2,215	15.2
365	Radio and television receiving sets (except communication types), phonographs, and phonograph records	1,110	8.4
366	Communication equipment	375	11.0
367	Electronic components or accessories	681	10.8
369	Miscellaneous electrical machinery, equipment, and supplies	1,803	24.6
371	Motor vehicles and motor vehicle equipment	31,312	3.2
372	Aircraft and parts	786	24.4
379	Miscellaneous transportation equipment	1,059	27.0
382	Measuring, controlling, and indicating instruments	229	14.8
386	Photographic equipment and supplies	401	13.6

TCC 201
Meat, Poultry, and Small Game; Fresh, Chilled or Frozen

TABLE 1. TCC GROUP 201--Percent Distribution of Geographic Division of Origin and Distance Shipped, by Means of Transport: 1967

Meat, Poultry, and Small Game; Fresh, Chilled or Frozen

Geographic division of origin and distance shipped	Number	Percent distribution by means of transport							
		All means of transport	Rail	Motor carrier	Private truck	Air	Water	Other	Unknown

¹Includes only shipments represented by bills of lading and invoices. Summary records which did not show individual weights of shipments are not included.

Appendix A

DEFINITIONS OF MAJOR TERMS

Shipment.--In this report, tons and ton-miles of shipments relate to production that actually moves by some means of transportation (other than pipeline, or under own power, or towed away) beyond the local area of the plant. These are usually called "intercity" shipments, even though neither the origin nor destination necessarily is in a city.

Average Length of Haul.--Average length of haul is based on straight-line miles from plant to customer or primary redistribution point. It is a weighted average derived by dividing ton-miles by tons. "Average distance" and "average length of haul" are synonymous.

Distance.--Distance is based on the straight-line miles between origin and destination cities in the United States, calculated by the use of PICADAD (described below). Straight-line distances are essentially identical to "great circle" or "air" distances. The distance factor for exports is based on the miles from the plant to the port of exit, because the ton-miles figures represent transport service within this country only.

Means of Transport.--Each shipping document is classified in terms of the major means of transport used to move the shipment to its destination. If more than one means was used, the transport used to cover the greatest distance was coded. If the shipment was made to a foreign destination, the type of transport used to move the shipment to the port of exit was coded. Means of transport was coded into seven categories as follows:

Rails.--Includes all shipments transported by railroad except railway express. If the word "piggyback" appeared on the shipping document, the shipment was coded as moving by railroad because the major distance was assumed to have been by railroad.

Motor carrier.--Includes all shipments transported by motor carriers that serve the public. If transport was indicated on the shipping documents by the words "truck," "cartage," "drayage," or "trucking," the shipment was coded as moving by motor carrier. No distinction was made between common or contract carriers. "For-hire" or commercial motor carriers are synonymous with "motor carrier" used in this report.

Private truck.--Includes all shipments transported by trucks operated by the shipper or the customer. The combination of private trucks and motor carriers represents virtually the total shipments by highway.

Air.--Includes all shipments by air, such as "air freight," "air express," and the like.

Water.--Includes all shipments transported by ship, boat, barge, and the like between two points in the United States. Shipments destined for foreign ports were coded "water" only if the major distance to the port of exit was negotiated by water. Otherwise, the

means used to transport the shipment to the port of exit was coded.

Other.--Includes shipments transported by means other than those classified above, except by pipeline. "Other" would include railway express, parcel post, freight forwarders, messenger service, hand carried parcels, bus delivery, etc.

Unknown.--Those shipping documents that gave no indication of the type of transport used to move the shipments are classed as unknown.

PICADAD.--This is a Census Bureau computer system used to automate the geographic aspects of this survey. One of its functions is to compute the straight-line mileage between the city of origin and the city of destination. A description of the system can be obtained from the Transportation Division, Bureau of the Census, Washington, D.C. 20233.

Production Areas.--Production Areas represent relatively compact geographic concentrations of manufacturing activity. Twenty-five Production Areas were developed for this survey. Each Production Area consists of one or more Standard Metropolitan Statistical Areas.¹

Ton-miles.--The figure for ton-miles is the product of weight times distance (straight-line miles). For example, a 10-ton shipment that moved between places that were 1,000 miles apart is equivalent to a 50-ton shipment that moved 200 miles. Both represent 10,000 ton-miles although they differ in terms of both weight and distance.

Tons.--The estimates of tons represent generally the shipping weight of commodities rather than net weight. Commodities in this sense represent any physical item, including scrap and waste. "Tons" and "tons originated" are synonymous.

Transportation Commodity Classification.--Transportation Commodity Classification (TCC) is used for all series in the Commodity Transportation Survey. It is a 5-digit code that represents an adaptation of the Standard Industrial Classification (SIC). The classification was prepared by the Bureau of the Budget principally for use in the census of transportation. However, it is now in widespread use. (The Interstate Commerce Commission has adopted a classification based on the TCC structure and railroads and motor carriers have adopted the "Standard Transportation Commodity Code," which is identical to TCC through the first five digits but is extended to seven digits to give more detail.) Only one commodity code was used for each shipment. If the shipping document contained a mixture of commodities, the code for the major commodity was assigned.

¹For definitions of SMSA's, see *Standard Metropolitan Statistical Areas, 1967*, Executive Office of the President, Bureau of the Budget.

Appendix B

CLASSIFICATION OF MANUFACTURING ESTABLISHMENTS INTO SHIPPER GROUPS

The classification into shipper groups was designed to divide the universe of manufacturing establishments into a limited number of more or less closely related classes of industrial activity of about equal size. The 24 groups are comparable to the major manufacturing components in the Federal Reserve Board's Index of Industrial Activity.

Shipper group number	Shipper group title
1	Meat and Dairy Products
2	Canned and Frozen Foods and Other Food Products, Except Meat and Dairy Products
3	Candy, Beverages, and Tobacco Products
4	Basic Textiles and Leather Products
5	Apparel and Related Products
6	Paper and Allied Products
7	Basic Chemicals, Plastics Materials, Synthetic Resins, Rubber, and Fibers
8	Drugs, Paints, and Other Chemical Products
9	Petroleum and Coal Products
10	Rubber and Plastics Products
11	Lumber and Wood Products, Except Furniture
12	Furniture, Fixtures, and Miscellaneous Manufactured Products
13	Stone, Clay, and Glass Products
14	Primary Iron and Steel Products
15	Primary Nonferrous Metal Products
16	Fabricated Metal Products, Except Metal Cans and Miscellaneous
17	Metal Cans and Miscellaneous Fabricated Metal Products
18	Industrial Machinery, Except Electrical
19	Machinery, Except Electrical and Industrial
20	Communications Products and Parts
21	Electrical Products and Supplies
22	Motor Vehicles and Equipment
23	Transportation Equipment, Except Motor Vehicles
24	Instruments, Photographic Equipment, Watches, and Clocks

Appendix C

PRODUCTION AREAS AND SELECTED STATES

Part 2 of the Commodity Transportation Survey presents data on commodity shipments for geographic areas. The focal point of this presentation is the transportation and geographic distribution of intercity shipments of commodities by manufacturing establishments in 25 major industrial centers (called Production Areas) and 20 selected States.

PRODUCTION AREAS

In order to obtain useful "point-to-point" tabulations, the following Production Areas have been developed for this survey. These areas were selected to represent relatively compact geographic concentrations of manufacturing activity. Each consists of one or more standard metropolitan statistical areas (SMSA)¹ which makes possible comparisons between traffic flow data and economic and demographic statistics available from other sources. The following list shows the Production Area number and its description (the SMSA's included in each area).

1. Boston, Mass.; Worcester, Mass.; Providence-Pawtucket-Warwick, R.I.-Mass.; Brockton, Mass.; Lawrence-Haverhill, Mass.-N.H.; and Lowell, Mass.
2. Hartford, Conn.; New Britain, Conn.; Meriden, Conn.; Waterbury, Conn.; New Haven, Conn.; Bridgeport, Conn.; Norwalk, Conn.; Stamford, Conn.; Springfield-Chicopee-Holyoke, Mass.-Conn.
3. New York, N.Y.
4. Newark, N.J.; Jersey City, N.J.; Paterson-Clifton-Passaic, N.J.; and Middlesex and Somerset counties, N.J.
5. Philadelphia, Pa.-N.J.; Wilmington, Del.-N.J.-Md.; Trenton, N.J.
6. Baltimore, Md.
7. Allentown-Bethlehem-Easton, Pa.-N.J.; and Reading, Pa.
8. Harrisburg, Pa.; Lancaster, Pa.; and York, Pa.

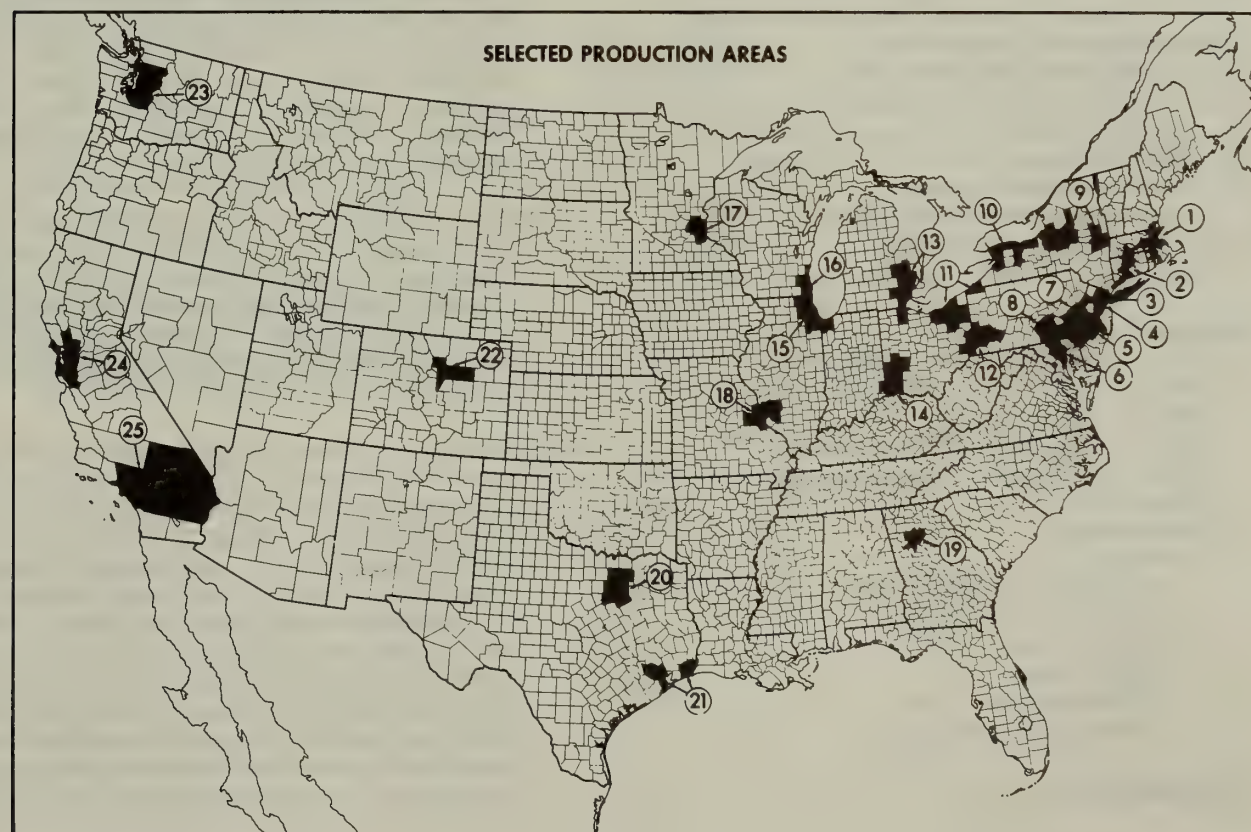

9. Syracuse, N.Y.; Utica-Rome, N.Y.; and Albany-Schenectady-Troy, N.Y.
10. Buffalo, N.Y.; and Rochester, N.Y.
11. Cleveland, Ohio; Akron, Ohio; Canton, Ohio; Lorain-Elyria, Ohio; Youngstown-Warren, Ohio; and Erie, Pa.
12. Pittsburgh, Pa.; Steubenville-Weirton, Ohio-W. Va.; and Wheeling, W. Va.-Ohio.
13. Detroit, Mich.; Flint, Mich.; Toledo, Ohio-Mich.; and Ann Arbor, Mich.
14. Cincinnati, Ohio-Ky.-Ind.; Dayton, Ohio; Hamilton-Middletown, Ohio; Springfield, Ohio.
15. Chicago, Ill.; and Gary-Hammond-East Chicago, Ind.
16. Milwaukee, Wis.; Kenosha, Wis.; and Racine, Wis.
17. Minneapolis-St. Paul, Minn.
18. St. Louis, Mo.-Ill.
19. Atlanta, Ga.
20. Dallas, Tex.; and Fort Worth, Tex.
21. Houston, Tex.; Beaumont-Port Arthur-Orange, Tex.; and Galveston-Texas City, Tex.
22. Denver, Colo.
23. Seattle-Everett, Wash.; and Tacoma, Wash.
24. San Francisco-Oakland, Calif.; Vallejo-Napa, Calif.; and San Jose, Calif.
25. Los Angeles-Long Beach, Calif.; Anaheim-Santa Ana-Garden Grove, Calif.; and San Bernardino-Riverside-Ontario, Calif.

STATES

The 20 selected States for which commodity data are presented are as follows:

Alabama	Massachusetts	Ohio
California	Michigan	Pennsylvania
Connecticut	Minnesota	Texas
Georgia	Missouri	Virginia
Illinois	New Jersey	Washington
Indiana	New York	Wisconsin
Maryland	North Carolina	

¹For definitions of SMSA's, see *Standard Metropolitan Statistical Areas, 1967*, Executive Office of the President, Bureau of the Budget.

Appendix D

DATA AVAILABLE FOR SPECIAL TABULATIONS

Printed reports provide the most essential and most widely useful data obtained by the census, but much more information can be made available to the public either in the form of special tabulations or special computer tapes. These special services often involve recoding geographic areas to be more nearly comparable to areas that are significant to a sponsor, and recoding or regrouping commodities or other data elements in the census base tapes. Also they sometimes involve the introduction of additional items that can be programed into the tape. However, they most commonly are undertaken to provide greater detail than presented in the published reports, and primarily involve summarization of data in the census base tape to the extent needed to avoid possible disclosure of activities of individuals.

THE BASE-TAPE SHIPMENT RECORD

In addition to technical information used for processing controls and related matters, the base tape contains the following:

Plant

- SIC—Standard Industrial Classification code
- Location—origin, geographic
 - (a) PICADAD key point code
 - (b) Census division-State code
 - (c) County code
 - (d) SMSA code
 - (e) Production Area code
 - (f) Freight rate territory code
- Plant size (employee size code)
- Shipping facilities at plant code

Shipment

- TCC—Transportation Commodity Code
- Packaging code
- Means-of-transport code
- Distance shipped (straight-line miles)
- Weight of shipment (actual pounds shown on document)
- Month shipped
- Destination
 - (a) PICADAD key point code
 - (b) Census division-State code
 - (c) County code
 - (d) SMSA code
 - (e) Production Area code
 - (f) Freight rate territory code

Expansion Factors

"PUBLIC USE" TAPES

Two "public-use" tapes have been developed from the preceding Commodity Transportation Survey base tape. One shows "origin-destination" commodity flows from 25 Production Areas to 59 destination areas, and is referred to as CTS-OD Tape No. 1. The other shows State-to-State commodity flows and is referred to as CTS-OD Tape No. 2.

CTS-OD Tape No. 1: Commodity Flows from Specified Production Areas to Destination Areas

1. *Source.* Summarization of shipping reports to the 1967 Census of Transportation—Commodity Transportation Survey.
2. *Major Purpose.* To supply building-block details (without disclosing activities of individual companies) of commodity flows by means of transportation from 25 major industrial origin areas to 59 destination areas.

The term "building block" detail refers to the fact that the records on the tape tend to represent the lowest common denominator (within confidentiality policy) to be used to "build" to a variety of significant aggregates. Most of the "blocks" will be too small to be significant without combining with others.

3. *Major Industrial Origin Areas.* These areas are the 25 Production Areas used in the 1963 and 1967 Commodity Transportation Surveys. Each of them consists of a large Standard Metropolitan Statistical Area or cluster of contiguous SMSA's that represent essentially a single geographic industrial complex.
4. *Destination Areas.* The 59 destination areas consist of the following: (a) 25 Production Areas that also represent major markets, plus (b) 25 market areas (large SMSA's that lie outside of the Production Areas) plus (c) the balance of all other destinations in each of nine Census Divisions. The 59 destination areas blanket all possible destinations in the United States. Since the main purpose of the survey was to measure intercity commodity flows by means of transport within the United States, each shipment to a foreign destination was coded to the port of exit (which was treated as the destination of the domestic segment in this tape)

provided the domestic segment involved more than a local movement. Otherwise, the foreign shipment was not included in the survey.

5. *Units of Measure.* The measurement of flows is expressed in terms of tons originated and straight-line ton-miles. The distance hauled may be considered to be a third unit of measure, and may be derived by dividing the ton-miles by the tons for any given commodity flow.
6. *Commodity Detail.* The *outbound* flow from each Production Area is presented in this tape for each TCC commodity level that is published in the 1967 Production Area Series. The detail consists of a "total all commodities" for each of the 25 origin production areas, broken into as many 2-, 3-, 4-, and 5-digit TCC commodity levels as were shown in the published production area report. The general guidelines for selecting each commodity level were: (a) At least five different companies (irrespective of number of "plants") reported shipments of the specified commodity from the specified origin area; (b) no potential disclosure was found; and (c) the sampling variability for the estimated tons (universe level) of the specified commodity from the specified origin area did not exceed ± 50 percent.
7. *Subject Content of Tape Record.* Each record on the tape is a fixed length and is a summary of all shipment records in the 1967 Commodity Transportation Survey in each indicated cell. As mentioned previously, these cells should be treated as "building blocks." The subject-content of each record is as follows:

	Digits
(a) Origin-production area	2
(b) Destination-market area	2
(c) Commodity	5
(d) Type of transport	1
(e) Weight block of shipment	2
(f) Estimated tons shipped (universe level) .	9
(g) Estimated ton-miles (universe level) . .	9
(h) Number of shipping records upon which estimate was based	6

CTS-OD Tape No. 2: Commodity Flows from State of Origin to State of Destination

1. *General:* This tape is derived from precisely the same basic information as the CTS-OD Tape No. 1. However, in contrast to Tape No. 1 which accounts only for the tons and ton-miles originating in Production Areas, Tape No. 2 accounts for the entire U.S. aggregate tons, ton-miles, and record counts, by originating State. This difference arises from the selection of origin-destination area pairs, and results in different commodity detail.
2. *General Purpose:* The general purpose of CTS-OD Tape No. 2 is similar to that described for CTS-OD Tape No. 1, except that this tape is designed for State-to-State traffic flows which cannot be derived from Tape No. 1.

POLICY REGARDING SPECIAL TABULATIONS AND UNPUBLISHED DATA

The Bureau publishes only the most essential and most widely useful data in its printed reports, but much more information is available to the public. The Bureau's policy in this area is described in Part II of any recent Bureau of the Census Catalogue.

The release of unpublished transportation data normally falls into the two following classes:

1. Special tabulations of selected data prepared for individual users on a reimbursable cost basis. The information may be furnished on tape, microfilm, punch cards, computer printouts, typewritten copy, or hand-posted tables. This class of unpublished data normally has limited interest beyond the initial users. It often involves recoding to approximate sponsor's own market areas, commodity groupings, or other special reclassifications to improve the usefulness to the sponsor of the general-purpose data in the Bureau's base file. The information (before being released) is thoroughly tested to avoid disclosures and to meet other policy requirements.
2. General-purpose information that provides greater detail than published. This information normally is furnished on a public-use tape.

Appendix E

SPECIAL REPORT: PRINTING, PUBLISHING, AND ALLIED INDUSTRIES (EXCEPT NEWSPAPERS AND PERIODICALS)

The printing and publishing industries were included for the first time in the 1967 Census of Transportation. Little was known previously regarding the transportation requirements of these industries, especially with respect to the volume of intercity or "long haul" traffic as compared with local distribution. For that reason, it was decided that a simple mail inquiry designed primarily to measure the general transportation and distribution patterns would meet the most urgent data needs, rather than the greater detail that is normally obtained for the Shipper Group Series of reports.

SCOPE, SAMPLE SIZE AND DESIGN

With respect to scope, this report was based on information obtained from a probability sample of plants that represented essentially the entire printing and publishing industry group, except newspaper and periodical publishers. As in the other parts of the Commodity Transportation Survey, establishments with less than 10 employees were not included.

A simple stratified sample was used. All plants in the "universe" were classified into three groups (based on total employees) which were sampled at the following rates:

Plant size (number of employees)	Sampling rate
250 employees or more	All
100 to 249 employees	1 in 3
10 to 99 employees	1 in 15

Replies were received from 94 percent of the sampled plants, some of which were out of business or were out of scope for other reasons. The data in this report were based on replies from 1,216 printing and publishing establishments, classified as shown below.

REPORT FORM AND BASIC DATA

Form TC-420 was mailed to each printing and publishing establishment in the sample. The value of products and services (item 2 of the questionnaire) was used as an indicator of the volume of shipments. An estimate of total tons shipped would have been preferable as a measure of the transportation volume, but a large proportion of the plants (establishments) would not have been able to provide estimates of tons. However, all of them were able to supply value figures. Within a single, relatively homogeneous industrial group, the physical volume of shipments (tons) generally tends to be highly correlated with the value of production.

The primary data items for this survey were the percentage distributions by distance and by transport (items 3 and 4 of the questionnaire). This information was requested in the form of percentage distributions rather than absolutes (tons or value) because the latter information usually is not available and is more difficult for shippers to estimate than relative distributions.

Information concerning shipping facilities (item 5) and exports (item 6) was obtained principally to supplement similar information obtained from all other industrial classes in the Commodity Transportation Survey.

The method for aggregating and expanding individual reports to universe-equivalent levels involved two steps. The first step consisted of expanding the total value of products and services of a plant (item 2) to its universe level by multiplying that value by the reciprocal of the sampling fraction for the plant. Specifically, all plants with 250 employees or more were in the sample and therefore were already at their universe level. Plants in the next strata were multiplied by "3" and those in the smallest strata by "15."

The second step consisted of converting the percentages in items 3, 4, and 6 into value equivalents, by multiplying the total value (universe level) by the percentages reported in each category. These value estimates for each plant were additive and used to develop the distributions shown in this report.

OTHER RELATED SURVEYS

A survey similar to this one was undertaken to obtain comparable traffic-pattern data from "small plants" in essentially all of the shipper groups covered by the 1967 Commodity Transportation Survey.¹ "Small plants" were defined for the purposes of that survey to be manufacturing establishments with 10 to 19 employees. Since Form TC-420 was used for both the small-plant survey and the printing and publishing survey, the data for the two surveys are comparable with respect to plants in the 10-to-19-employees size class.

The same form was also used for larger printing and publishing plants, but the larger plants in other industrial groups were surveyed by a different method,² based on collecting detail data from probability samples of bills of lading (or other shipping records) to measure commodity flows in terms of volume (tons and ton-miles), by origin and destination, means of transport, industrial class of shipper, etc.

Rough comparisons may be made between the percentage distributions by means of transport and distance shown in the Shipper Group Series and corresponding data for printing and publishing, provided allowance is made for the fact that shipper-group data were based on intercity or "long-haul" shipments, while the printing and publishing "flows" represent total output, including products used in or near the plants.

SUMMARY OF FINDINGS

The results of this survey are not only of interest with respect to the printing and publishing industries, but also useful as a demonstration of the potential applications of this mail technique for measuring transportation and distribution profiles of other shipper groups—especially those for which detailed traffic data would be difficult to report, or those for which general traffic patterns reasonably satisfy the primary needs for information. This summary of findings deals with both the general aspects of method as well as the specific data for the printing and publishing industries.

The distribution of products by distance provides a useful index to the size of markets served by the plants—size measured in terms of the radius of area. Among the most interesting findings is the similarity in the size of the market areas served by the printing and publishing plants as compared with all other industrial shippers, *after* allowances for differences in local shipments. As shown in table A, about 63 percent of the total value of products of small printing and publishing plants were used in or near the plant or shipped less than 50 miles. This compares with about 53 percent for plants in that size group in all other shipper groups.

In general, larger plants tend to ship a smaller percentage of their output to local areas than do smaller plants. The larger printing and publishing plants reported that about 35 percent of their output was shipped less than 50 miles, as compared with 63

percent for smaller plants in this industry. Probably an even smaller percent would have been found for larger plants in other shipper groups, but a specific estimate cannot be made because the sample of shipping documents does not show products used in or near the plant.

The adjustment for differences in local-area volumes was based on a 50-mile radius, because that range was the shortest radius that was common to each of the sources used in this survey and doubtless included all of the "local" traffic plus some short-haul intercity.

Turning to the market patterns beyond the 50-mile radius (table A), the percentage distributions by mileage block are very similar between printing and publishing and "all other" shipper groups in each of the two size classes. Although there was some tendency for the larger size class of plants to ship a larger share to more distant markets, the difference in the general patterns between large and small plants was not substantial, *after* allowance for volumes shipped less than 50 miles.

Sharp differences were found, however, in transport shares as shown in table A. Among the 10-to-19-employees size plants, the major difference was in motor carriers as compared with "other" carriers which include parcel post, rail express, United Parcel, etc. More specifically, motor carriers handled 50 percent of all shipments for this size class for industrial shippers in general, as compared with only 27 percent for this size class in printing and publishing. The difference was accounted for by the 32 percent share of printing and publishing industries shipped by "other" carriers as compared with 3.5 percent share for other shippers in that size class.

For plants having 20 or more employees, the major difference between industrial shippers generally and the printing and publishing group is found in the rail share, although substantial differences also occur in several other means of transport. The rail share of printing and publishing shipments is about 7 percent of the total traffic in contrast to 45 percent for plants in that size class in all other industrial groups. The printing and publishing plants shipped a somewhat larger share of products by each of the other means of transport (except water) than did this size class in industry generally. A substantial part of the differences in carrier shares probably is attributable to the inclusion of local hauls in printing and publishing but not in data for other shippers.

The printing and publishing (except newspapers and periodicals) group represented by this survey was composed of seven industry classes. In general, motor carriers and private trucks were the primary means of transport, as shown in table B, but there were some significant exceptions. For example, "other" transport (parcel post, rail express, United Parcel, etc.) handled about one-third of the total shipments of three industry classes—Books, Miscellaneous Publishing, and Service Industries (SIC 273, 274, and 279)—but a substantially smaller portion of the other printing and publishing classes. Motor carriers were particularly dominant in the Manifold Business Forms and the Greeting Cards classes (SIC 276 and 277), although they also were the leading carriers for most of the other classes. As expected, the private trucks were more prominent for Commercial Printing and Service Industry classes (SIC 275 and 279) than for the other industry classes.

With respect to the size of the market area served (i.e., distance shipped) by printing and publishing establishments, slightly more than one-third of the total value of products and services were used in or near the plants, or shipped less than 50 miles. As shown in table B, the market areas for Commercial Printing,

¹Data were derived from a mail survey representing essentially all plants in this size class. That mail survey was also undertaken as part of the 1967 Commodity Transportation Survey.

²Data were derived from the Shipper Group Series, 1967 Commodity Transportation Survey.

³Not available because reports for that phase of the survey were based on intercity shipments; the volume of "local" shipments is not known.

Blankbooks and Related Works, and Service Industries, were more localized than the other classes. At the other extreme was the Greeting Cards class (SIC 277) for which only about 6 percent of the product was shipped less than 50 miles and over 50 percent was shipped more than 500 miles.

The general intermodal patterns of distribution by size of plant, as shown in table C, reflect the probable dominance of small shipments by all plant sizes. About 84 percent of the total value of products were shipped by motor carriers, private trucks, and "other" (i.e., parcel post, rail express, United Parcel, etc.) combined. That group of carriers hauled 89 percent of the total for the two smallest plant-size classes, 87 percent for plants with 100 to 249 employees, and 79 percent for larger plants. Within that group of three types of transport, the motor-carrier share increased with plant size. The private truck share reached its peak with the 20-to-99-employees size group and the "other" transport share peaked with the smallest plants. The relative patterns for those three types of carriers appear to reflect the variations in the length of haul shown in the distance portion of table C and are

generally in harmony with findings developed for other shipper groups in the Commodity Transportation Survey.

Regional patterns are shown in table D. Motor carriers transport about 45 percent of the total shipments, with only minor variations among regions. However, the private truck share differs markedly among regions, with a high of 39 percent in the West compared with a low of 20 percent in the North Central Region. Freight forwarders and "other" transport are more commonly used in the Northeast and North Central than in the South and West Regions.

With respect to length of haul—or radius of market areas—it is worth noting that 62 percent of the shipments in the West Region are to destinations less than 100 miles from the plants, as compared with 52 percent in the Northeast, 45 percent in the South, and 38 percent in the North Central Region. Stated differently, the market areas served by printing and publishing plants in the North Central Region are larger, as measured by distance from plants, than in any other region of the country.

BRIEF APPRAISAL OF MAIL-SURVEY TECHNIQUE

This mail survey was undertaken partly to obtain data on the transportation and distribution patterns of the printing and publishing industries and partly to serve as a demonstration project to appraise the usefulness of this approach for application to other shipper groups. A similar mail survey was used to obtain 1967 data from a sample of small plants (specifically in the 10-to-19-employees size class) in each of the shipper groups included in the 1963 and 1967 Commodity Transportation Surveys. The following brief appraisal is based on the experience of both projects.

The mail technique has been used so far only in two types of situations: (1) Where little was known regarding the transportation and geographic distribution patterns and an "over-view" was desirable, or (2) the relative volume of intercity tonnage is known to be small and it was thought that the primary public interest would be served by figures showing general patterns, without incurring the expense and effort to obtain detailed information from samples of shipping records needed for detailed origin-destination and tonnage data. The first situation is illustrated by the printing and publishing project and the second by the survey of small plants (10 to 19 employees) in the industrial universe.

On the plus side, the mail technique (as used in these two projects) is much less expensive. The shippers apparently had little difficulty in reporting the requested information, although most of the replies doubtless were estimates based on day-to-day experience rather than records. The response rates were good.

The quality of response also appears to have been good, as judged by an analysis of similarities and differences in patterns shown by the mail survey as compared with roughly comparable information obtained from the samples of shipping papers.

However, the amount of detail obtainable by the mail technique appears to be limited largely to the types of information collected by the 1967 form. A pilot test some years ago included a request for percentage estimates of the total value of products shipped by the plant to each of the nine Census geographic divisions. An outline map was printed on the form to clearly show the States included in each division. The shippers reported that it was difficult to estimate distributions by geographic divisions or States, largely because their market areas often do not follow State lines and most of their market information was on a product (not plant) basis. In multiplant companies, the personnel who are most conversant with marketing normally are oriented on product lines for the company generally and find it difficult to provide estimates on a plant basis. Furthermore, the mail technique is not suitable for collecting data on tons, ton-miles, commodities (except to the extent implied by the SIC classification of the plant), or origin-destination flows.

In brief, a mail survey appears to be a low-cost, simple method for measuring the transportation and geographic distribution patterns of almost all classes of establishments—nonmanufacturing as well as manufacturing activities. However, it is not an alternative method for situations in which origin-destination and commodity details are needed or for measuring traffic flows in terms of tons and ton-miles.

Highway.....	85.5	86.2	75.9	91.1
Water.....	17.4	17.7	26.3	3.4
Air.....	78.0	79.2	72.6	73.6
None.....	7.5	5.2	24.1	8.9
No answer.....	3.2	4.0	-	-

¹Standard metropolitan statistical areas. For definition, see Standard Metropolitan Statistical Areas: 1967, Executive office of the President, Bureau of the Budget.

²Includes local movement.

³With respect to interpretation, an establishment that checked both rail and highway would be counted in both lines. One that checked rail, highway, water, and air, would be counted in each of the first four lines. Consequently, the data are not additive.

Appendix F

SPECIAL REPORT: TRAFFIC PATTERNS OF SMALL MANUFACTURING PLANTS

PURPOSE OF REPORT

This report is being issued for two major purposes: First, to present transportation and distribution data for the "small plant" segment (establishments with 10 to 19 employees) of the shipper groups in the 1967 Commodity Transportation Survey; second, to review selected aspects of the survey method used in this project particularly with respect to its potential use in the 1972 census program.

RELATIONSHIP TO COMMODITY TRANSPORTATION SURVEY PROGRAM

The first national Commodity Transportation Survey was taken in 1963 to obtain detailed data on the transportation and distribution of products by essentially the entire industrial sector of the United States. The basic data were obtained by asking a sample of manufacturing plants to select systematic samples of bills of lading or other shipping papers in their files. Detailed facts were reported for each sampled shipment, including origin, destination, commodity, weight, and means of transport.

The 1963 survey showed that the primary distribution of products by plants with less than 20 employees tended to be local, and that this segment of industry generated only about 4 percent of the total intercity tons shipped by all manufacturing plants. On the other hand, "small plants" constitute about two-thirds of the total number of establishments in the industrial universe.

These findings led to the conclusion that survey costs and the reporting effort for small plants could be reduced by using a different reporting plan without substantially reducing the primary usefulness of the traffic-flow data. Plants with less than 10 employees represented such a small percentage of the total intercity shipments that this group was omitted entirely from all samples in 1967. Plants with 10 to 19 employees were sampled, but were asked to report by mail on only the general characteristics of their shipping pattern.

SAMPLE SIZE AND DESIGN

The intended universe for the small-plant sector included all establishments with 10 to 19 employees in the industries represented by the Commodity Transportation Survey.¹ However, the universe tapes for two shipper groups were unintentionally omitted from the "universe" at the time the sample was drawn. Since this "small plant" survey was experimental, it was decided that the results of 22 out of 24 shipper classes would be adequate for the study. The two unintentionally omitted groups were: Shipper Group 1—Meat and Dairy Products, and Shipper Group 2—Canned and Frozen Foods.

A simple random sample was drawn in which each establishment had one chance in 18 of being selected. Reports were received from about 95 percent of the gross sample, which provided a net sample of 1,711 reporting plants (as shown in table A) that represented all shipper groups in the Nation.²

The sample was distributed among the four regions in proportion to the total number of plants of this size class (10 to 19 employees) in each area. As shown in table A, there were 648 reporting plants in the Northeast Region, compared with 458 in the North Central, 323 in the South, and 282 in the West. The largest shipper group nationally was Group 5, Apparel and Related Products with 213 reporting plants, and the smallest was Shipper Group 9, Petroleum and Coal Products with 16 plants. Traffic patterns are shown in the tables for shipper groups and shipper classes that had 10 or more reporting plants in the sample.

Data for nine of the 24 shipper groups are shown for each of the four regions. At the other extreme, six of the 24 shipper groups did not have as many as 10 plants in the sample in any region, and consequently their traffic patterns are shown only at the national level.

REPORT FORM AND BASIC DATA

Form TC-420 was mailed to each establishment in the sample. The value of products and services (item 2 of the questionnaire) was used as an indicator of the volume of shipments. An estimate of total tons shipped would have been preferable as a measure of the transportation volume, but a large proportion of the plants would not have been able to provide estimates of tons. However, all of them were able to supply estimates based on total value figures. Within a single, relatively homogeneous industrial group, the physical volume of shipments (tons) generally tends to be highly correlated with the value of production. In heterogeneous industrial or shipper groups, the percentage distributions tend to reflect the patterns of shippers of high value product to a greater extent than would have been the case if tonnage rather than value had been used.

The primary data items for this survey were the percentage distributions by distance and by transport (items 3 and 4 of the questionnaire). This information was requested in the form of percentage distributions rather than absolutes (tons or value) because the latter information usually is not available and is more difficult for shippers to estimate than relative distributions.

Information concerning shipping facilities (item 5) and exports (item 6) was requested principally to supplement similar information obtained for all plants in the Commodity Transportation Survey with 20 or more employees.

The method for estimating the "traffic patterns" as indicated by percent distributions consisted of two steps. The first step was the conversion of the percentages in items 3, 4, and 6 into estimated value of shipments for each plant. This was done by multiplying the reported total value of products and services (item 2) by the percentages reported in each category. Since the

¹The universe included all industries in the census of manufactures, except:

SIC 19—Ordnance and accessories
SIC 2026—Fluid milk
SIC 205—Bakery products
SIC 2097—Manufactured ice
SIC 241—Primary forest products
SIC 27—Printing, publishing and allied industries (This group, however, was surveyed by the mail form and the results issued in a separate report).

²Except for shipper groups 1 and 2.

Plants not shown by shipper group in region.....		-	42	55	53	64

* Less than 10 plants were in the net sample for the region; traffic patterns are not shown for these cells in tables.

probability of selection of each plant was identical (i.e., 1 in 18) the estimated values for each plant were directly additive without raising to universe levels. Consequently, the second step involved the aggregation of plant values and computation of percentage distributions for groups of plants shown in the tables.

OTHER RELATED SURVEYS

A similar survey was taken to obtain comparable traffic-pattern data for the printing and publishing industry, except newspapers and periodicals.³ The same report form was used (TC-420), but the sample represented plants in all size classes⁴ in contrast to the single size class in this survey. The data for the two surveys are comparable in all other respects.

Rough comparisons may be made between the percentage distributions by means of transportation and distance in each of

³See report on "Printing, Publishing, and Allied Industries (Except Newspapers and Periodicals)," in the Commodity Transportation Survey.

⁴Except that manufacturing plants with less than 10 employees were not included in any phase of the Commodity Transportation Survey.

the shipper groups represented by this survey with corresponding percentage distributions of tons in the Shipper Group Series of reports, providing allowance is made for differences created by local shipments. The Shipper Group data relate to intercity or long-haul shipments, while the distributions for small manufacturing plants and for printing and publishing include products used in or near the plant.

SUMMARY OF 1967 COMMODITY FLOWS

About half of the total volume of shipments by small plants was hauled by motor carriers and almost a third by private trucks, as shown in table B. The railroad share was about 6 percent, freight forwarders, 5 percent, and air, 3 percent.

The carrier shares differ substantially among regions. For example, the motor carrier share was 75 percent in the West compared with 23 percent in the South. In contrast, the private truck share was highest in the South (58 percent) and lowest in the West (14 percent). The rail share was close to 5 percent in all

FORM TC-420
(8-21-67)

U.S. DEPARTMENT OF COMMERCE
BUREAU OF THE CENSUS

1967 CENSUS OF TRANSPORTATION
Commodity Transportation Survey

Item 1.

INSTRUCTIONS

If book figures are not readily available, please supply your best estimates for the plant shown in item 1.

If you transfer goods from this plant to a nearby warehouse for redistribution, report shipments from that point as though it were from this plant. If you ship to foreign countries, consider only the movement from plant to the port of exit when reporting percentage for mileage and type of transport.

Return this form to, Bureau of the Census, Washington, D.C., 20233, in the enclosed envelope which requires no postage.

Item 2. VALUE OF PRODUCTS AND SERVICES

What was the value of all products shipped and services performed at this plant (including interplant transfers) during 1967?

Dollars only

\$

Item 3. DISTANCE SHIPPED

What percent of item 2 moved?

- a. Less than 50 miles (including used in or near plant)
- b. 50 — 99 miles
- c. 100 — 299 miles
- d. 300 — 499 miles
- e. 500 — 999 miles
- f. 1,000 miles or more

Total of above should equal —————→

Percent

100%

Item 4. TYPE OF TRANSPORT

(If your shipments move by a combination of two or more types of transport, consider ONLY the one type of transport used for the major portion of the movement IN THE U.S. in estimating percentages.)

What percent of the products were shipped by:

- a. Rail
- b. Commercial (for hire) motor carrier
- c. Your own or customer's truck
- d. Air (including air cargo and air express)
- e. Water (including for hire and private carriers on rivers, harbors, lakes, ocean, etc.)
- f. Freight forwarder
- g. Other — Describe on reverse side
- Total of above should equal 100% of products shipped from your plant —————→

Percent

100%

Item 5. SHIPPING FACILITIES

Does the plant identified in item 1 have any of the following shipping facilities?

(Mark as many as apply)

- a. ☐ Rail siding
- b. ☐ Access to an interstate highway system within 5 miles of the plant site
- c. ☐ Water loading and unloading facilities within 5 miles of the plant site
- d. ☐ An airport offering air cargo service located within 25 miles of the plant site
- e. ☐ None of the above applies

Item 6. PRODUCTS OF THIS PLANT EXPORTED

- a. Were any products of this plant exported by your company or shipped to others for export without further processing?

☐ Yes

☐ No

- b. If "Yes," about what percent of the total (item 2) was shipped to foreign countries?

Percent

Item 7. PERSON TO CONTACT

a. Name

b. Title

c. Telephone — Area code and number

d. Date

USE REVERSE SIDE FOR ANY COMMENTS YOU MAY HAVE

regions except the South, where it reached 10 percent. Air, as might be expected, had a larger share in the West than in other regions.

The market areas for products shipped by small plants tend to be relatively small (as indicated by distance from plant). Over half of the total volume remained within a radius of 50 miles, and nearly three-fourths remained within a radius of 300 miles as shown in table C.

With respect to foreign shipments, it is interesting to note that small plants exported approximately the same percentage of their total output as did industry generally. More specifically, small plants exported about 2.9 percent of their total 1967 output (see table D) as compared with 2.7 percent of the total for industry

generally, as estimated by the "Survey of the Origin of Exports of Manufactured Products: 1966"⁵

Essentially the same relative level of exports was found also in the Shipper Group Series of reports, after allowance for differences in scope and definitions. About 2.5 percent of the total intercity tonnage shipped by plants with 20 employees or more was shipped by the originating plant to foreign destinations. The estimate was based on bills of lading or other shipping paper that had a foreign destination. This is an underestimate of

⁵This survey was undertaken by the Industry Division, Bureau of the Census, and was designed to represent the value of shipments exported (or known to have been exported) by all manufacturers. A comparable definition of exports was used in the small plant survey, but the two surveys in other respects were completely independent.

Table E. Percent Distribution of Shipments by Available Facility, for Geographic Regions: 1967

Available facility ¹	United States	North-east	North Central	South	West
Rail.....	16.0	9.3	15.7	27.6	16.0
Interstate highway.....	63.0	56.8	67.0	59.4	74.8
Water.....	13.7	16.7	13.1	11.1	11.0
Air.....	53.1	48.3	55.9	51.7	61.0
None.....	24.8	33.2	19.0	23.8	16.0
Not answered.....	2.9	1.7	4.1	3.1	3.2

¹Since many plants have more than one type of shipping facility available, the sum of the percentages exceeds 100 percent. Each establishment was requested to indicate the types of transportation available by checking boxes for one or more of the following items: rail siding; access to an interstate highway system within 5 miles of the plant site; water loading and unloading facilities within 5 miles of the plant site; airport offering air cargo service located within 25 miles of the plant site; none of the above applies.

the total foreign shipments because it did not include tonnages shipped to redistribution points or other receivers for possible reconsignment, or for exports that did not involve an intercity haul within the United States to reach the port (or point) of exit.

With respect to shipping facilities, about 16 percent of the small plants reported that they had rail sidings and about 14 percent were located within 5 miles of water loading and unloading facilities. Nearly two-thirds were located within 5 miles of the interstate highway system, and over half were within 25 miles of an airport offering air cargo service. These percentages add to more than 100 percent because most plants had access to more than one type of shipping facility. However, it is worth noting in table E that about 25 percent of the small plants reported that none of these types of shipping facilities were available.

QUALITY OF RESPONSE

Since most of the small manufacturing plants do not maintain book records on the percentage distribution of shipments by means of transport and distance, the reports doubtless were largely based on day-to-day experience of plant personnel. This raises the question as the validity of traffic patterns or percentage distributions for groups of plants based on those reports.

With respect to the designation of types of carrier and the estimation of carrier shares at *each plant*, the quality of response appears to have been good. That impression is based on an "in house" review of individual reports for a substantial number of plants. It was found that the reports for most small plants stated that 90 percent or more of the value of products was shipped by one means of transport. Under that situation, there seems to be little likelihood of error in identifying the major means of transport or incorrectly approximating its share of the total. The estimates of minor shares may contain substantial *relative* errors, such as an estimate of 1 or 2 percent by air when the true situation might be half or double that amount.

In terms of the basic objective, to measure the general patterns, a more serious opportunity for response error lies in situations where substantial amounts move by two or more types of carrier—such as 40 percent by motor carrier, 35 percent by private carrier, 20 percent by rail, and 5 percent spread among the other modes. Fortunately, from the standpoint of response error, this type of situation is relatively rare, as judged by a detailed review of several shipper groups.

For example, Shipper Group 18, Industrial Machinery, was represented by 158 plants. Out of that sample, 62 plants

reported 98 to 100 percent of their shipments by *only* one means of transport and 29 others reported between 90 and 97 percent by one means—meaning that almost 3 out of 5 plants shipped over 90 percent of their total shipments either by motor carrier, private truck, freight forwarder, rail, or other *single* means of transport. There were 42 other plants (representing about one-fourth of the sample for shipper group 18) that reported the leading type of transport accounted for 70 to 89 percent of the total shipped. Nearly half of those plants used highway transport exclusively, which provided a relatively good basis for the highway share in contrast to nonhighway, although the relationship between motor carrier and private truck may have been somewhat rough.

Finally, 25 plants (only about 16 percent of the sample for that Shipper Group) spread their traffic among carriers in such a manner that no single mode accounted for as much as 70 percent of the total. The main source of response error with respect to the *principal* carrier in this shipper group pattern probably rests in this relatively small group. These reports are typically answered in round numbers, such as 60 percent motor carrier and 40 percent freight forwarder; or occasionally spread among all modes, such as 5 percent rail, 40 percent motor carrier, 50 percent private carrier, 40 percent freight forwarder, and 1 percent air.

The tendency for shipments from any given plant to concentrate on one mode of transport was found to be common in the two other shipper groups analyzed. For example, 25 out of the 31 plants in the sample for Shipper Group 6, Paper and Allied Products, shipped 90 percent or more of the total for the plant by *only one* mode of transport. Similarly, 10 out of 23 plants in Shipper Group 7, Basic Chemicals, Plastics Materials, Synthetic Resins, Rubber, and Fibers, shipped more than 90 percent of their products by *one* means of transport.

The reasonableness of the response by small plants also was judged by comparisons with individual plant traffic patterns based on sample of bills of lading or other shipping papers in which judgement or estimates by plant personnel were not involved. Traffic patterns were found in the 1963 and again in the 1967 surveys to differ by size of plant within shipper groups. For this 1967 spot test, the small-plant (10 to 19 employees) patterns were compared with corresponding data developed from bills of lading or other shipping-document reports from establishments in the next larger plant-size group (20 to 49 employees) for which detailed reports were available. The major difference was the fact that the shipping papers related to intercity shipments, but the small-plant data included local as well as

Table F. Percent Distribution of Shipments by Means of Transport, for Shipper Groups: 1967 and 1963

Shipper group	Rail	Motor carrier	Private truck	Air	Water	Other
03. Candy, beverages, and tobacco products:						
1967.....	1.1	21.9	63.9	-	-	13.1

1963.....	1.0	22.0	76.2	-	-	.8
17. Metal cans and miscellaneous fabricated metal products:						
1967.....	8.3	38.6	45.0	.9	.1	7.1
1963.....	-	35.9	62.2	-	-	1.9
18. Industrial machinery, except electrical:						
1967.....	2.4	37.3	43.2	2.6	1.0	13.5
1963.....	1.3	83.1	10.0	.4	.3	4.9
19. Machinery, except electrical and industrial:						
1967.....	.2	85.8	8.1	4.4	-	1.5
1963.....	.2	86.1	10.3	.2	-	3.2
20. Communications products and parts:						
1967.....	5.5	30.5	16.4	20.6	-	27.0
1963.....	2.1	91.8	1.3	2.0	-	2.8
21. Electrical products and supplies:						
1967.....	4.7	55.6	26.0	7.7	-	6.0
1963.....	.7	95.0	2.6	.1	.3	1.3
22. Motor vehicles and equipment:						
1967.....	.1	21.4	72.2	-	-	6.3
1963.....	.4	53.4	39.0	.2	-	7.0
23. Transportation equipment, except motor vehicles:						
1967.....	1.3	45.2	28.1	18.1	3.0	4.3
1963.....	-	8.1	73.2	-	4.5	14.2
24. Instruments, photographic equipment, watches, and clocks:						
1967.....	6.9	31.0	9.5	9.9	.3	42.4
1963.....	.4	43.1	2.3	1.2	.5	52.5

Note: The 1963 and 1967 data are not precisely comparable because (a) the 1963 data are based on intercity shipments by plants that shipped at least 10 percent of their total tonnage beyond the local area, thus eliminating all local shipments and intercity shipments by predominately local plants; (b) the 1967 survey represented all plants and included local shipments (See the text for further discussion of the 1963 and 1967 comparisons.); and (c) in 1963, sampling "bills of lading" or similar shipping documents resulted in omission of most parcel post shipments.

Table G. Percent Distribution of Shipments by Distance, for Shipper Groups: 1967 and 1963

Note: The 1963 and 1967 data are not precisely comparable because (a) the 1963 data are based on intercity shipments by plants that shipped at least 10 percent of their total tonnage beyond the local area, thus eliminating all local shipments and intercity shipments by predominately local plants; (b) the 1967 survey represented all plants and included local shipments (See the text for further discussion of the 1963 and 1967 comparisons.); and (c) in 1963, sampling "bills of lading" or similar shipping documents resulted in omission of most parcel post shipments.

intercity. Since the test was limited to comparisons within a specified shipper group, the use of tons in the larger-plant size sample and value in the smaller-plant size sample probably did not substantially affect the percentage distributions.

A strong tendency to rely primarily on one means of transport was found in both plant-size categories in the two shipper groups tested. In Shipper Group 6, Paper and Allied Products, about 59 percent (35 out of 59 plants) in the 20-to-49-employees size class shipped 90 percent or more of their products by only one means of transport. This is compared to the small-plant sample where 81 percent (25 out of 31 plants) shipped 90 percent or more of their production by only one means of transport.

In Shipper Group 7, Basic Chemicals, 53 percent (39 out of 73 plants) in the 20-to-49-employees size class shipped 90 percent or more of their products by only one means of transport. This is compared to the small-plant sample where 43 percent (10 out of 23 plants) shipped 90 percent or more of their production by only one means of transport.

Turning to the percentage distributions by distance, comparisons similar to the ones above could be made between plants in the 10-to-19-employees size class with those in the 20-to-49-employees size class. The inclusion of local shipments in one and exclusion from the other necessarily creates noncomparability that cannot be readily adjusted. In general, relatively few plants maintain records by mileage blocks, although distance is a major consideration in traffic management, transport costs, and time. The progressions from short to long distances reported in 1967 appear to conform somewhat better to the anticipated pattern than did the 1963 data, which were based on details from individual intercity shipments. Perhaps the somewhat smoother progressions in 1967 reflect, in part, the "smoothing effect" of judgment and avoidance of variations caused by differences in the interpretation of "local" for reporting purposes. However, it appears that the data realistically outline the general distribution patterns.

TENTATIVE PLANS FOR 1972

This appraisal has been made principally with the hope that it will stimulate comments and suggestions by others, particularly with respect to action that should be taken in the scheduled 1972 Commodity Transportation Survey.

The study was undertaken largely for two purposes. One was to determine whether this relatively simple and low-cost survey technique could cut sharply the reporting effort and survey costs for the small-plant segment of the industrial universe, but still obtain essential data on intermodal shares and geographic distribution of the market.

The other primary purpose was to determine whether this survey technique was sufficiently promising to be extended to non-manufacturing activity, such as wholesalers. The aim would be not only to obtain data on the general intermodal and geographic distributions, but also to identify specific classes of activity that generate considerable volumes of intercity shipments for which more detailed data may be needed and which probably could be obtained by the survey method used for larger plants in the 1967 Commodity Transportation Survey.

With respect to the first objective, the response was good, both as to the rate of response and apparent quality. So far as could be determined, shippers were able to supply the information readily. The tentative plan is to use this system essentially unchanged, except with respect to the sample design in 1972. The small-plant class probably will be stratified by shipper groups with differential sampling rates. This would tend to equalize both the number of plants in the sample for each shipper group and the sampling variability among the shipper groups. A larger total sample should be used, especially if data are needed for the 86 shipper classes rather than the 24 groups.

With respect to the second objective—extension to shippers outside the present scope of the Commodity Transportation Survey—the results of this test are promising when considered along with the results of this survey method for plants of all size classes in the printing and publishing industry. The probable extension will be the wholesale trade.

Appendix G

SPECIAL REPORT: U.S. EXPORT SHIPMENTS REPORTED IN THE 1967 CENSUS OF TRANSPORTATION

This technical report is issued for the purpose of analyzing and summarizing data on interior origins and domestic means of transport of export shipments as reported by manufacturers in the 1967 Commodity Transportation Survey.

BACKGROUND

The Commodity Transportation Survey is part of the Census of Transportation program and is designed principally to obtain data on *intercity* commodity flows *within* the United States, generated by manufacturing enterprises. The source of the basic data is a probability subsample of bills of lading or other shipping documents on file at manufacturing plants on a probability sample.

Each manufacturing establishment in the sample was requested to report, among other things, the commodity, weight, means of transport, and destination for each of its sampled shipments. About 97.5 percent of the total tons shipped were to domestic destinations and a small percentage of the documents showed foreign destinations. For those export shipments, the shipper was asked to report the "port of exit" as the destination of the domestic segment, and to list the foreign country of destination. The objective was to measure specifically the domestic segment and to explore the feasibility and usefulness of obtaining supplementary information on foreign destinations.

The balance of this report deals with a summary of the findings and an initial appraisal of the results.

EXPORTS AS DEFINED IN THIS REPORT

As mentioned earlier, the basic information was obtained from a sample of bills of lading or other shipping records. One item of information supplied was the "destination" defined as the last place shown on the shipping document. If that place was a foreign country, the shipper was asked to name the country and also to show the port of exit. In some cases, the respondent provided only the foreign destination and Census Bureau analysts selected a probable port for purposes of tabulation. This could be handled readily, and did not create a substantial problem.

The survey however, did not represent all classes of foreign shipments because the following types did not have a chance of being reported as "foreign:"

- a. Shipments that were loaded directly from plant to ocean vessel or required only a "local" haul within the United States were not included. For example, a shipment from a plant located in Brooklyn, N.Y., to Norway would *not* be included in the Commodity Transportation Survey because it involved *only* a local haul within the United States. However, if the Brooklyn plant shipped the product to Boston by truck for export by vessel, the shipment would be included because the truck shipment within the United States was "intercity." The fact that it was exported to Norway was not controlling. No information was requested concerning the transportation used on the international segment.
- b. Some shipments are "rollers" in the sense that the producing plant ships them to another department, plant, or agent for storage or reconsignment. The record at the originating plant

shows the location of the storage or agent, but often does not show the place to which it subsequently may have been reconsigned. For example, a plant in Indiana may ship a product to Jersey City, and the Indiana traffic department may know that normally the product subsequently is shipped to some country in Europe. Since the shipping paper at the Indiana plant shows Jersey City as the last point, it would be reported as a domestic shipment. There probably were some instances in which the traffic pattern is so well known and consistent that the plant may have reported a foreign country even though it isn't on the document.

- c. Shipments from the plant to customers (even though those customers may be known to be exporters) would be reported as domestic shipments, unless the shipping record at the manufacturing plant showed a foreign destination. The movements from the exporter to foreign points or to other places within the United States were not covered by the survey.

COMPARISON WITH OTHER EXPORT DATA—GENERAL LEVEL

In brief, the foreign commodity flows included in the 1967 Commodity Transportation Survey represent shipments from manufacturing plants (a) that required more than a local movement *within* the United States, and (b) for which foreign country of destination was shown on the shipping paper at the producing plant or was known by the person completing the census report. These shipments are clearly less than the total exports of manufactured products and less than the total exported by manufacturers.

The Industry Division of the Bureau of Census conducted a "Survey of the Origin of Exports of Manufactured Products: 1966"¹ in which a sample of manufacturers was asked to report the f.o.b. plant value of their products known to them to have been exported. It is estimated that the total reported by the manufacturers in 1966 was about 71 percent of the total exports of manufactured products. The remaining 29 percent was exported by wholesalers or other purchasers whose intention to export was not known to the manufacturers, except for a relatively small volume that may have been exported by small manufacturers that were not within the scope of the survey.

There appears to be no readily available basis for estimating how much of the 71 percent was accounted for by shipments that were *not* actually exported by the manufacturer (but known to be destined for export) and by shipments that did not involve a *domestic intercity* haul preceding exportation. The Commodity Transportation Survey necessarily represents less than 71 percent of the total exports of manufactured products, and no attempt was made to estimate the magnitude of total exports.

RELATIVE VOLUME OF EXPORTS BY INDUSTRIAL CLASSES

Turning attention to the "profile" or characteristics of export movements shown by this survey, some crude comparisons may be useful. Table 1 shows that about 2.5 percent of the total

¹ Current Industrial Reports Series: MA-161(66)-1.

intercity tonnage shipped by manufacturers was exported. The total value of exports was about 3.9 percent² of the total value of shipments by all manufacturers. The significance of the lower percentage in the Commodity Transportation Survey is in part explained by several considerations. In the Commodity Transportation Survey, probably a substantial part of the tons actually exported was not reported as exports. This is because the ultimate destination was unknown to the manufacturer, but was part of the total intercity shipments. Another portion (that is, shipments that didn't involve domestic intercity hauls) was not included in either the total or the export segments. In the survey of the Origin of Exports of Manufactured Products, the percentage of "total value" suffers not only for aspects mentioned earlier, but also by the fact that a summation of the "value of shipments" at a 2-digit level involves duplication. For example, the value of shipments from a flour mill to a bakery is reported as flour production, and its value becomes part of the value of the production of bakery products. Further, the Commodity Transportation Survey excluded ordnance and printing and publishing commodity classes while the census of manufactures included them.

The main usefulness of the comparisons in table 1 lies in the similarity of profiles by industrial classes. The table supports an impression that the tonnage data represent the universe described above. For example, Machinery and Instruments are outstandingly high both with respect to percent of tons and percent of production exported. Chemicals and Transport Equipment are somewhat lower by both measurements. Apparel is 1 percent or less in both measurements, as might be expected, since most exports of these products probably are made by nonmanufacturing exporters.

GEOGRAPHIC DISTRIBUTION OF ORIGINS

Table 2 shows the geographic distribution of origins of exports, as estimated by the Commodity Transportation Survey (1967) and the "Survey of the Origin of Exports of Manufactured Products" (1966). The first percentage distribution (or "profile") is based on the relative distribution of *tons* that involved an intercity domestic movement before being exported, and the second is based on distribution of the *value* of products known by the manufacturer to have been exported. These comparisons provide additional indications of the apparent reasonableness of the tonnage data. For most industrial classes, the two profiles are roughly similar. For example, the profiles for Stone, Clay, and Glass and Primary Metal Products show origins in all regions of the country and the relative distributions of tons and values are quite similar. Paper and Allied Products, Machinery (except electric), and Transportation Equipment are concentrated largely in two areas.

On the other hand, strikingly different situations were found for a few industrial classes. For example, in Food and Kindred Products, the tonnage profile differs from its value profile. This may reflect extensive volumes moving through nonmanufacturing export channels, known to the manufacturers but not routed by them and consequently not reported in the tonnage. It also could reflect a rather low correlation between the value and shipping weight for this industrial class—probably less than exists in almost any other "industrial class" other than Apparel. Other sources of differences could be mentioned, including sampling variability.

There are several profiles of an intermediate type where similarities appear in most regions, but sharp differences are

found in a few. For example, the profiles for Chemicals and Allied Products are similar in all geographic divisions, except in Middle Atlantic and South Atlantic States.

DISTRIBUTION BY MEANS OF TRANSPORT ON DOMESTIC SEGMENT

Table 3 shows the estimated total tons of exports for each of the 24 shipper groups and the percent distribution by means of transport *used for the domestic haul* from interior point to port of exit. About one-third of the total tons was exported by manufacturing plants in Petroleum and Coal Products. For that reason, two total lines are shown in table 3—one represents all exports estimated by the survey, and the other represents the total, exclusive of the Petroleum and Coal Products shipper group.

About 45 percent of the total export tons (including petroleum) was shipped from plant to port of export by water as compared with 33 and 21 percent by rail and highway, respectively. *Excluding* the Petroleum and Coal Products group, rail becomes the leading carrier (45 percent), followed by 29 percent by highway and 25 percent by water.

Extremely wide variations are found among shipper groups with respect to the relative distribution among means of transport. For example, the railroad share ranged from a low of 7 percent for Shipper Group 9, Petroleum and Coal Products, and 8 percent for Shipper Group 5, Apparel, and Shipper Group 24, Instruments, to a high of 74 percent for Shipper Group 13, Stone, Clay, and Glass. Similarly, the highway shares ranged from a low of 3 percent for Shipper Group 9, Petroleum and Coal Products, and 9 percent for Shipper Group 2, Canned Foods, to a high of 85 for Shipper Group 4, Textile Mill Products.

Some shipments were reported by air in each of the 24 shipper groups. However as shown by table 3, the relative volume (tonnage basis) by air was small, reaching a maximum of 13 percent for Shipper Group 20, Communications Products and Parts and 8 percent for Shipper Group 23, Transportation Equipment. The air share was less than one-half of 1 percent in 13 of the 24 groups.

Water transportation was used for over 80 percent of the tonnage of Shipper Group 9, Petroleum and Coal Products, and Shipper Group 8, Drugs, Paints, and Other Chemicals; 35 percent of Shipper Group 2, Canned Foods; and 29 percent of Shipper Group 6, Paper.

SIZE OF SAMPLE

The total sample for the 1967 Commodity Transportation Survey consisted of about 1.4 million shipping documents from a probability sample of about 11,000 reporting manufacturing plants. Of those 1.4 million reports, 31,464 had foreign destinations and were used in these export tabulations. The sample within each plant was a random sample,³ generally without stratification or differential sampling rates among classes of shipments by the plant.

As shown by table 4 in comparison with table 3, the distribution of the number of observations (that is, shipment reports) by means of transportation is *not* proportionate to the amount of tonnage shipped. Instead the distribution of the number of

²Total value of exports estimated from "Survey of the Origin of Exports of Manufactured Products: 1966." Table 1, divided by the total value of shipments of manufactured products from the "Annual Survey of Manufactures: 1966."

\$21.3 billion
\$538.5 billion = 3.9 percent.

³As a general rule, sampling rates were established in each plant to obtain a random sample of about 100 to 200 shipping papers for the plant, such as 1 in 10 shipments for plants with 1,500 total records on file for the year or 1 in 50 for plants with between 5,000 and 10,000 records, etc. This gave as much chance for a small shipment by air to be drawn as a large shipment by rail or water. In most instances, it was not operationally feasible for respondents to draw a stratified sample, using differential rates.

observations tends to be proportionate to the distribution of the number of documents in traffic files. It is interesting to note that a slightly smaller number of observations were in the sample for rail shipments than for air, although rails accounted for 33 percent of the total tons as compared with less than 0.5 percent by air. The highway sample contained almost 19,000 observations—about four times the number for rail and air. The water estimates were based on 1,236 observations.

With respect to geographic distribution shown in table 5, the Mountain Division, as expected, had the smallest sample, with only 358 export shipments of all kinds originating in that area and the East North Central Division had the most—9,024 shipments. It is also worth noting the wide geographic distribution by shipper groups. Table 5 contains 216 regional-industry group cells, composed of nine divisions times 24 shipper groups. Only 10 of those 216 cells are blank. However, with respect to reliable estimates of tons exported, the sample in the vast majority of cells is exceedingly small and the sampling variability very high.

TENTATIVE APPRAISAL OF THE EXPORT SHIPMENTS STUDY

This report is made principally in the hope that it will stimulate comments and suggestions by others, particularly regarding action that should be taken in the scheduled 1972 Commodity Transportation Survey.

The study was undertaken for two purposes. One was to obtain new data that are not available from other sources. The other was purely technical, and designed to improve the reporting or imputation of the destinations of the domestic segment of the movements. With respect to the technical purpose, the study proved to be worthwhile in assuring that the domestic movement of export shipments would not be omitted.

In view of the present almost complete lack of data on the transportation and geographic characteristics of the domestic segment of exports, the study clearly has thrown new light into that almost "pitch black" area. The information was obtained essentially as a byproduct of the major survey and involved only a nominal increase in reporting effort and survey costs.

However, despite those favorable aspects, the public interest probably would be better served by a separate survey designed specifically to obtain data on the interior origins and destinations of export trade, and the transportation and geographic characteristics of those movements. A small-scale survey of this type was taken in 1956.⁴ A much larger survey is currently in the planning stage to obtain domestic origin-destination transportation data and tie them in with the international segment for 1970.⁵ With respect to the potential of this approach, the size of the sample can be set at any desired level. The universe from which the sample can be drawn represents total imports and exports as reported to the Foreign Trade Division of the Census Bureau. The source of information would be the importer or exporter of record. This approach avoids the main limitations described above with respect to export information derived from the Commodity Transportation Survey.

A firm recommendation of action on the 1972 Commodity Transportation Survey program necessarily will await comments and suggestions with regard to aspects raised by this report.⁶ An analysis of the results of the proposed 1970 survey of the origin-destination of U.S. foreign trade also should be taken into consideration.

⁴"Domestic Movement of Selected Commodities in United States Waterborne Foreign Trade" by the Bureau of Census, funded by the Corps of Army Engineers and Traffic Executive Association—Eastern Railroads.

⁵Planned to be taken by the Census Bureau as agent for Department of Transportation and Corps of Army Engineers.

⁶Send comments to Donald E. Church, Chief, Transportation Division, Bureau of the Census, Washington, D.C. 20233.

Rubber and plastics products.....	10	30	1.8	2.8
Lumber and wood products.....	11	24	2.8	2.6
Furniture and fixtures.....	12	25	.8	.5
Stone, clay, and glass products.....	13	32	1.0	2.0
Primary metal products.....	14, 15	33	1.2	2.2
Fabricated metal products.....	16, 17	34	2.4	3.1
Machinery, except electric.....	18, 19	35	6.9	9.1
Electric machinery and communication.....	20, 21	36	2.8	3.6
Transportation equipment.....	22, 23	37	4.8	4.8
Instruments and miscellaneous.....	24	38	8.7	8.9

Note: The Shipper Group code is used in Commodity Transportation Survey and Standard Industrial Classification code is used in Census of Manufactures. The shipper and SIC groups are roughly comparable in most instances, except for "Lumber and Wood Products" and "Stone, Clay, and Glass Products." See text for further discussion.

¹Based on tons reported to be exported divided by total tons in Commodity Transportation Survey.

²Based on the table 1 value of exports f.o.b. plant in the 1966 "Origin of Exports" survey described in the text, divided by total value of shipments in the same industrial class in the 1966 Annual Survey of Manufactures.

TABLE 2. Profiles of Geographic Distribution of Origins of Exports of Manufactured Products

Industrial classes	United States	Percent distribution by geographic division ¹								
		New England	Middle Atlantic	East North Central	West North Central	South Atlantic	East South Central	West South Central	Mountain	Pacific

21. Electrical products and supplies.....	338	100	47	47	2	3	1
22. Motor vehicles and equipment.....	1,831	100	63	37	-	-	-
23. Transportation equipment, except motor vehicles.....	207	100	47	45	8	-	-
24. Instruments, photographic equipment, watches, and clocks.....	131	100	8	83	5	4	-

(-) Less than 1 percent.

TABLE 4. Sample Size--Number of Export Shipments in Sample, by Means of Transport

Shipper group	Total	Rail	Highway	Air	Water	Other
Total shipments.....	31,464	4,144	18,924	4,820	1,236	2,340
01. Meat and dairy products.....	334	79	220	4	21	10
02. Canned and frozen foods and other food products, except meat and dairy products.....	1,437	296	907	14	214	6
03. Candy, beverages, and tobacco products.....	795	189	473	38	74	21
04. Basic textiles and leather products.....	912	63	730	39	27	53
05. Apparel and related products.....	191	9	129	28	1	24
06. Paper and allied products.....	920	206	534	51	88	41
07. Basic chemicals, plastics materials, synthetic resins, rubber, and fibers.....	1,928	315	1,337	118	81	77
08. Drugs, paints, and other chemical products.....	1,281	129	753	250	104	45
09. Petroleum and coal products.....	753	262	400	9	52	30
10. Rubber and plastics products.....	986	25	788	113	11	49
11. Lumber and wood products, except furniture.....	567	197	203	24	137	6
12. Furniture, fixtures, and miscellaneous manufactured products.....	579	21	338	89	50	81
13. Stone, clay, and glass products.....	1,548	473	881	67	39	88
14. Primary iron and steel products.....	927	185	658	40	21	23
15. Primary nonferrous metal products.....	880	99	600	112	26	43
16. Fabricated metal products, except metal cans and miscellaneous.....	1,222	100	898	64	69	91
17. Metal cans and miscellaneous fabricated metal products.....	1,458	100	1,044	169	29	116
18. Industrial machinery, except electrical.....	2,866	99	1,838	536	31	362
19. Machinery, except electrical and industrial.....	4,203	479	2,480	872	42	330
20. Communications products and parts.....	1,912	63	568	1,012	38	231
21. Electrical products and supplies.....	1,598	113	890	381	26	188
22. Motor vehicles and equipment.....	1,593	568	879	90	7	49
23. Transportation equipment, except motor vehicles....	1,224	43	619	394	25	143
24. Instruments, photographic equipment, watches, and clocks.....	1,350	31	757	306	23	233

Note: Foreign shipments portion of the 1967 Commodity Transportation Survey. A shipment is the movement of products recorded on a bill of lading or similar shipping paper. 90 percent of the total tons in the 1967 Commodity Transportation Survey was transcribed from bills of lading or similar shipping documents. The remaining 10 percent was from summary records. The summary records did not show export information.

TABLE 5. Sample Size--Number of Export Shipments in Sample,
by Geographic Division of Origin

Shipper group	United States	New England	Middle Atlantic	East North Central	West North Central	South Atlantic	East South Central	West South Central	Mountain	Pacific
Total shipments.....	31,464	3,617	7,733	9,024	1,821	2,240	987	1,717	358	3,967
01. Meat and dairy products.....	334	4	76	53	94	64	25	10	-	8
02. Canned and frozen foods and other food products, except meat and dairy products..	1,437	10	169	94	64	80	4	194	2	820
